

Dear Teacher!

This is the Bugwise School information package for you and your students. With the package, you can learn about indoor hygiene*, some infectious disease-causing germs, or microbes, and microbiological sampling.

*Indoor hygiene means infection prevention and control with built environment. For example, an electronic faucet or automatic lighting reduces contact with the faucet or light switch and thus prevents the germs from spreading from hand to hand and from person to person.

To support **the teacher**, there are instructions, of which this is one. It is a good idea to familiarize yourself with the instructions before using the material together with the students.

There is also something for **the students** to do. Students can, among other things, do the microbiological sampling themselves with the DipSlide sampling stick. Some of the instructions are aimed at students and

can be utilized if desired. The teacher can guide the activities to be done individually, in pairs, or in groups.

In addition, there is a mobile game that can be downloaded from Apple and Android app stores for free. For this too, there is a guide in the material package.

All written material can be found and printed on the website www.popoviisas.fi. The website also has videos of microbiological sampling with DipSlide.

For more information, or to order DipSlide sticks, contact the developers of the Bugwise School, contact information is available on the website.

With the same contact info, please, give roses and twigs. Both are gratefully accepted for the further development of the package.
